Introduction

The Kingdom of Saudi Arabia is making rapid advancement with a rapid pace in the economic, social, and technological sphere in a planned manner with a purpose to produce knowledge economy. Besides, the development of a wide range of industries, the government of KSA is encouraging IT based industries to play their role in the country's development. To achieve the goals of such an economic transformation requires deliberate planning and vigilant execution of MIS based systems. Therefore, development of MIS professionals is important to bring about this planned economic transformation in the country. With the expansion of industrial development, the demand for MIS professionals is also increasing. Keeping in view the kingdom's present and future demand of MIS professionals, the program of BBA in MIS has been designed to cater to this need. Through this program effective MIS skills will be inculcated among undergraduate students to deal with challenges and problems of industries. Under globalization of world economies and rapidly changing technology, Saudi Arabian industries are facing intense competition. Through imparting effective MIS skills based on the core knowledge areas of MIS, this program will endeavor to produce professionals who will propel the transformation of Saudi Arabia towards the knowledge economy in line with Vision 2030.

Program vision

“To establish a tradition of teaching our students body core business education fundamentals in the areas of management, accounting, finance, economics, and management information Systems.”

Program mission

To provide students with quality education in the management of technology, business decision making and ethical practices.

We prepare our students for the challenges and expectations of today's job market and to be lifelong learners. The MIS program emphasizes technical skills and knowledge acquisition, excellent classroom and online instruction, communication skills, critical thinking, practical applications and research acumen.

Program objectives

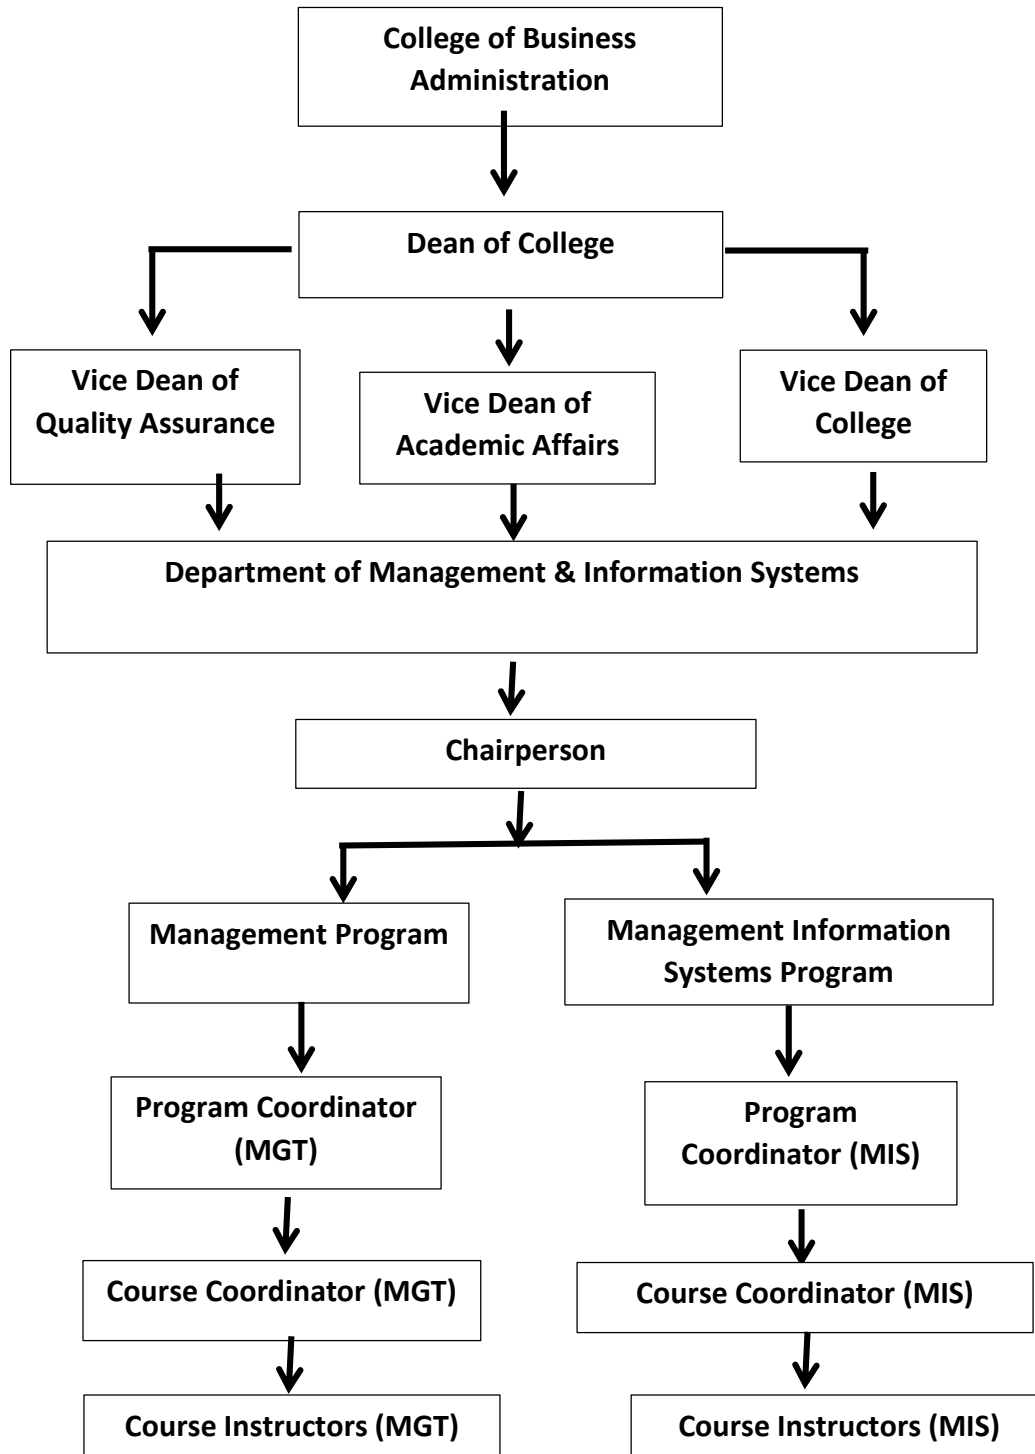

The overall goal for the MIS Program is to graduate students who will possess the knowledge and the skills necessary to be successful in the Management Information Systems field. More specifically our goals include the students being able to:

- a) Utilize necessary skills to successfully manage systems development projects.
- b) Effectively use and administer Information Systems in different business settings.

- c) Acquire and apply analytical skills which will enable them to visualize a complex business problem and make informed decisions based on available information and technology resources.
- d) Apply problem solving skills which will allow them to model information systems solutions for business problems.
- e) Have a deep understanding of the business and professional responsibilities related to the use of information systems in organizations.

Measurable Objectives
1. Develop the skill sets that focus on IT service delivery as defined in our mission statement.
2. Research that strengthens the MIS curriculum through multiple concept- driven course offerings. Multiple concept-driven courses are courses whose origins arise from extensive correlational research on two or more different subject areas within the MIS concentration.
3. To educate students on managerial concepts and principles in the development and operation of information systems, systems analysis and design and IT project management.
4. Start IT Service training and development programs for the practitioners from public and private sectors to empower manpower to meet the IT challenges of 21st century effectively and efficiently.
5. Ensuring graduate students campus recruitment in reputed private/public organizations.

Admission requirements

Admission into First Year

Admission into the First year of all programs in the College follows the general admission requirements of UOH.

Graduation requirements

Students in the Management Information System (MIS) program are required to complete 126 semester-credit-hours covering general educational requirements, core requirements and some elective courses.

Academic reference standards of program

1. Attributes of Undergraduates

Recent developments in Information and communication technologies have redefined the role of MIS in an organization from being merely a tool of management reporting to that of business transformation. The new information systems, such as supply chain management, customer relationship management, and e-business systems, enable organizations to integrate business processes across organizational boundaries and create a networked enterprise. Improved inter-organizational coordination, agility, and flexibility across the value chain characterize a networked enterprise due to the implementation of state-of-the-art MIS. Now days, the web, communication and database technologies are maturing and their usage has begun to extend throughout every area of business practices. These new information technologies are being employed in expansive and creative ways across the private and public organizations. The result is that the need for MIS professionals has increased. MIS is now a "people skill" rather than a purely "technical skill". The MIS program offered by the CBA, UoH produces "**business analysts**" or "systems analyst" or "consultant" rather than "programmers". This requires skills in identifying user and consumer problems and translating these needs into technology solutions.

After the entry-level analyst role, most MIS professionals become "project managers" (or "senior consultants") where they assume the responsibility for an entire technology projects: planning; staffing; budgeting; implementation scheduling; training and operational maintenance.

This MIS program provides the skill set to enter any of the following general areas within the information technology arena:

1. Analyst/Project Manager - This is the currently the most common path for the MIS professional and most entry level jobs for MIS majors fall into this category. The two central courses in the MIS curriculum (Systems Analysis and Design, and IT Project Management) provide the core skill set for the program.

2. Database Technologies- Central to most every technology application is the database where the transaction and archival data resides. The Business Data Management course is a required skill along with the course Decision Support System.

3. IT Infrastructure - The role of computer hardware, networking, security and communications technologies continues to expand with "mobile technologies" and "cloud computing" becoming a common part of every corporate computing environment. This area continues to grow and offer new job opportunities for MIS professionals as the existing technologies mature and new infrastructure opportunities are implemented.

There are three courses namely fundamentals of computer networks, IT service Management, and Information Security are available to support students interested in these roles.

4. IT Consulting- In addition to roles in traditional corporate MIS environments, consulting firms provide another employment avenue for our graduates. There are many large and small technology consulting firms that provide expertise in all areas of MIS. These firms are often employed to provide: specialized IT solutions; large-scale project development alternatives; and MIS planning and strategic management services. There are courses like fundamentals of e-commerce, Integrated Systems and Managing ERP, Social and Ethical Issues of the Internet, Business Analytics & Mgmt. Applications which covers the roles and skills sets needed for the future MIS consultant.

5. IT Audit and Compliance - New to the MIS arena is the emergence of IT Auditing and compliance. This had resulting in significant internal controls being established for financial reporting and transaction processing systems. Additionally, all publicly traded companies have teams that utilize IT expertise in that area. The courses like Business Law, Social and Ethical Issues of the Internet and fundamentals of e-commerce will cover the areas of IT Audit and compliance).

A. Knowledge and Understanding:

The MIS graduates will demonstrate comprehensive knowledge and clear understanding of the core of the MIS profession as follows:

1. Acquire understanding of the core concepts of the MIS as the significance of Information systems (IS) in an organization, particularly in reference of information technology revolution; the difference between information systems and information technology; the different types of information systems i.e., transactional information systems, executive information systems, knowledge information systems, and strategic information systems.

Understand and appreciate the strategic role of information systems in an organization and learn how to manage IT-enabled business transformation and services;

2. Understand information systems Infrastructure, need of building flexible and robust Information system architecture, role of business process re-engineering in designing IS infrastructure, role of data centre and network resources in enterprise-wide business applications.

3. Understand fundamentals of computer networks i.e., significance of computer networks in business; management issues associated with computer networks, network resource planning and design for corporate applications, and sub-netting design for an IP based network.

جامعة هائل
University of Ha'il

4. Understand basics of Data Base Management and its usages i.e., storing data in databases and the role of database management systems, role of data models and the different views of business users and database designers, concepts of sharing of data in the distributed resources environment and data integration, and significance of data warehouse and the concept of meta data and their practical applications.
5. Understand the application of IT service Management systems in business organizations.
6. Application of IS for Human Resource, Accounting, and Finance.
7. In-depth understanding of the enterprise systems and their business and managerial implications in the organizations, transactional and planning information systems, role of ERP, CRM, SCM, e-auctions, EAI, and e-business portals in establishing business networks.
8. Understand the role of the business intelligence in the fields of marketing, finance, human resources, and production; develop a decision making approach to business intelligence technology; business intelligence frameworks and architecture; use of customer data to understand customers and create value for an organization; application of data collected in an organization to create intelligence and knowledge.
9. Understand the various types of information security threats and their implications in organizations; in-depth understanding of managerial, organizational, and legal issues associated with information and internet security; develop a policy framework to analyze information security issues; acquaintance with the various information security standards and protocols; various security technologies such as firewall, cryptography, SSL, and one time password; risk management approach in information security planning.
10. Understand the impact of Information Systems on Business Organization performance.

11. Acquire technical, interpersonal, communication, managerial, team-work, and coordination skills.
12. Learn the methods of applying techniques, and technology in a functional and productive manner in the work environment.
13. Learn about decision support systems, resource and people management applications, project management tools, and database management technologies.
14. Able to tackle real-world business problems both independently and in teams.
15. Define the macro- and micro-economic concepts and methods of economic analysis and the ability to apply these to a range of business problems.
16. Describe the methods for the analysis and synthesis of data using a range of mathematical techniques, supported by appropriate software to inform business decisions.
17. Explain how accounting statements are prepared with the ability to interpret these and other financial and managerial accounting information in an organizational context.
18. State the theories which explain individual and group behaviors and their relationship with the internal functioning of the organization.
19. Describe the legal environment within which local, regional and international commerce is conducted.
20. Explain the management and exploitation of information systems and the use of broader information and communication technologies.
21. Describe managerial concepts and principles in the development and operation of information systems.
22. Define system analysis and design and IT project management.
23. Describe theories and concepts related to data management, basic data structure.

24. Define the process and practices for the effective management of organizations and decision-making within them by integrating technologies.
25. Memorize the theory of the business concept and the practical management applications of sustainability of profitability.
26. Recognize project management methods with special emphasis on earned value analysis.
27. Describe a comprehensive, coherent and systematic body of knowledge in management domain and related disciplines.
28. List the latest developments in area of MIS practices and theories including current research in the MIS domain and related disciplines.
29. Recall the interrelatedness of all the different aspects of business, including their local, regional and international dimensions.
30. Able to define the fundamentals of marketing and consumer behavior, and the processes by which marketing plans and strategies are constructed.
31. Outline business policy and strategy; how appropriate policies and strategies are developed to meet the challenges of a changing environment and to achieve organizational goals.

B. Intellectual and practical skills (Cognitive Skills)

1. Apply modern tools, techniques, and technology in a functional and productive manner in their professional activities;
2. Analyze, design, construct, implement and maintain, usable, reliable, and cost-effective Information System (IS), which support operational, managerial, and strategic activities of organizations;
3. Analyze, design, manipulate, and implement relational databases on which most Information System are built upon;

4. Plan, coordinate, monitor, and control Information System development projects;
5. Study and evaluate existing manual and automated business processes, and identify opportunities for re-engineering and/or automation;
6. Coordinate confidently and competently with the use community in Information System requirements analysis/design activities, and provide guidance and technical support to end user computing activities;
7. Support Information System Managers in their management activities particularly in database administration, information system development project management, selection/adoption of the latest tools and techniques;
8. Be equipped with technical skills necessary to build and operate e-commerce and e-business endeavors;
9. Appreciate the use of Information System for effective management; and pursue graduate studies in MIS or equivalent area.
10. Analyze organizations, their structures and how they are managed within the context of national and international business, economic and political organizations which form the business environment.
11. Analyze the processes and practices for the effective management of organizations and decision-making within them.
12. Evaluate the creation of value through the integrated production and distribution of goods, services and information.
13. Analyze the sources, uses and management of finance within the organization and its relationship with external financial markets and the management of risk.
14. Evaluate business policy and strategy; how appropriate policies and strategies are developed to meet the challenges of a changing environment and to achieve organizational goals.
15. Analyze the increasing importance of sustainability.

16. Evaluate the interrelatedness of all the different aspects of business, including their local, regional and international dimensions.
17. Examine the dynamics of Global Economy and role of technology in integrating global business environment
18. Observe domestic and global economic environments of organizations.

C. Transferable skills and other attributes (Interpersonal Skills & Responsibility)

1. Develop communication skills and ability to read, write and make oral presentations in English.
2. Ability to appreciate issues of selection, accuracy, uncertainty and approximation with numbers and statistical analysis.
3. Ability to use word processing, spreadsheet, database, power point, and the use of internet to search and retrieve relevant information.
4. Ability to schedule tasks in order of importance and use personal resources and available time effectively to accomplish tasks and meet deadlines.
5. Ability to maintain independence of thought and be self-reliant. At the same time appreciate and respect different views of others and work effectively with them.
6. Ability to understand customer expectations and the importance of a customer orientation and customer service to all organizations.
7. Demonstrate ethics, professional codes of conduct, corporate governance and corporate social responsibility.
8. Demonstrate multicultural and diversity understanding
9. Demonstrate ethical and legal responsibilities in organizations and society

جامعة حائل
University of Ha'il

D. Communication, Information Technology, Numerical

1. Develop Methods for the analysis and synthesis of data using a range of mathematical techniques, supported by appropriate software to inform business decisions.
2. Examine the management and exploitation of information systems and the use of broader information and communication technologies.
3. Develop communication Abilities.
4. Develop analytical Skills.
5. Examine information technologies as they influence the structure and processes of organizations and economies, and as they influence the roles and techniques of management.

Program intended learning outcomes (PLO's)

A. Knowledge and Understanding:

- 1.1 Outline emerging information technologies, their integration, management, strategies and business implications. Lectures, case studies, class discussions. Mid-term exams, final exam, assignments, quizzes., class work
- 1.2 Show a comprehensive understanding of methods for analysis and synthesis of data using mathematical and statistical techniques and appropriate software to support business decision making.
- 1.3 Record and prepare accounting and financial statements and their interpretation.
- 1.4 Reproduce theories and concepts of information security, e-commerce and service desk technologies, IT service management and social and ethical issues of internet.
- 1.5 State concepts, principles and processes in development, structure and operations of information systems, systems analysis and web design.
- 1.6 Describe concepts of hardware, software, file management, operating systems and IT project management.
- 1.7 Define theories and concepts related to database design and management, data warehouse and data mining.
- 1.8 List the processes, practices and systems of communication, organizational behaviour, decision-making and project management.
- 1.9 Recognize business intelligence, modelling, and networking concepts and applications.

- 1.10 Demonstrate an understanding of business performance analysis concepts and strategies, practical applications of sustainability, information management and profitability.
- 1.11 State the fundamentals of marketing and consumer behaviour, and the processes by which marketing plans and strategies are constructed.
- 1.12 Define macro and micro-economic concepts and methods of economic analysis and list their applications to business problems
- 1.13 Demonstrate knowledge of networking models, communication, topologies, devices, types, media and switching.
- 1.14 Describe management of projects, their structure, tasks, resources, schedules and models.
- 1.15 Recognize the characteristics of the Islamic culture as it relates to the local society, business and other related aspects of the society.

B Cognitive Skills

- 2.1 Design and explain organizational structures, modelling business processes, business analytics, risk management and role of systems.
- 2.2 Explain the processes and practices for the effective management of organizations, group communication and decision-making within them.
- 2.3 Demonstrate the ability to analyse value creation through the integrated marketing, sales and production system and online distribution of goods, services and information.
- 2.4 Analyze the sources, uses and management of finances; their reporting systems; accounting and financial statements; and relationship with external markets.

- 2.5 Justify the importance of systems for information dissemination, HR and strategic management.
- 2.6 Analyze the interrelatedness of all the different aspects of business, including their local, regional and international dimensions.
- 2.7 Analyze and compare the domestic and global economic environments of organizations in IT era.
- 2.8 Write and explain networking protocols, layered architecture standards, information security and web development technologies, operating systems and mobile computing.
- 2.9 Appraise modelling of business situations, hierarchical structuring of data items, fast insertion and searching and develop diagrams.
- 2.10 Evaluate configurations of IT architecture, information resources strategic alliances, and sourcing strategies.
- 2.11 Apply concepts of requirements analysis, logical and data modelling, database design and querying, views, triggers and normalization.
- 2.12 Evaluate IT projects and explain their development, scheduling, customization, integration, optimization and consolidation.
- 2.13 Explain the socio-cultural, religious and legal aspects related to local society and their application in the KSA environment.

3.0 Interpersonal Skills & Responsibility

- 3.1 Analyze customer expectations and the importance of a customer orientation and customer service to all organizations.

3.2 Illustrate legal responsibilities, ethics, belief, professional codes of conduct, corporate governance and corporate social responsibility.

3.3 Demonstrate working in groups, deployment of group-work softwares, integrated and group support systems.

3.4 Analyse real business situations and create solutions by using IT.

3.5 Demonstrate understanding of multiculturalism and diversity.

4.0 Communication, Information Technology and Numerical Skills

4.1 Interpret the methods for analysis and synthesis of data using mathematical techniques with use of appropriate software for the business decisions.

4.2 Demonstrate the development, management and exploitation of information systems.

4.3 Assess the communication, problem solving and analytical skills.

4.4 Assess performance in MS office, concepts of IT service management, process modeling, database and enterprise applications exercises.

4.5 Evaluate performance in web development, user interface and content information systems.

Course description

Course Code: MGT101	Course Name: Principles of Management	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

To provide students with understanding of basic principles, concepts, terminology and practices of management in all types of enterprises. Students will be introduced to management theory, research and practice. Particular attention will be given to the basic managerial functions such as planning, organizing, directing and controlling. Whenever possible, efforts will be made to relate these materials to management in Saudi Arabia. The objective of principles of Management is to guide the professional development of the students by focusing on the core competencies of effective managers. The main learning outcome of the course will be as follows:

1. The students will learn theories which explain individual and group behaviors and their relationship with the internal functioning of the organization.
2. The students will learn about the processes and practices for the effective management of organizations and decision-making within them.
3. The students will learn about the effective strategies for the management and development of people within the organization.
4. The students will learn about the increasing importance of sustainability.
5. The students will develop communication abilities.
6. The students will develop ethical understanding and reasoning abilities.
7. The students will be able to understand the dynamics of the global economy.
8. The students will develop multicultural and diversity understanding.

Course Code: FIN101	Course Name: Financial Management	
Credits: 3 (3+0+0)	Pre-requisite: ACC101 & ECN101	Language: English

This course covers theories, concepts, and analytical techniques in financial management, evaluation of financial goals and objectives, overview of financial markets and institutions, financial statements and cash flows, time value of money, ratio analysis, working capital management, short-term financing operating and financial leverages, financial forecasting and planning, capital budgeting techniques. This course is designed to provide a comprehensive initialization and introduction to the field of financial management. The core emphasis is laid on the processes and methodology of financial statement analysis, which can be applied in corporate sector and used as guidelines in assessing, interpreting and planning financial data to meet the objectives of managing a business entity effectively.

Briefly, the learning outcomes for students will be as under:

1. The students will understand the value of financial management in corporate sector and the value of financial implications in the success or failure of a firm/project.
2. They will comprehend domestic financial markets and institutions and how firms obtain funds in the financial markets and at what cost.
3. They will be able to forecast a firm's financial needs.
4. They will understand how to manage the working capital of a firm efficiently.
5. They will be able to define financial leverage and its far reaching effects on the business domain of a firm.
6. Students will be able to apply and interpret the basic valuation concepts in finance.
7. They will analyze and determine the value of a firm's securities and the improvisations of management to influence these values.
8. They will be able to determine the financial risks facing by a firm, and identifying the factors affecting the value of a firm financially.
9. They will be able to critically analyze the performance of a firm and determine its strengths and weaknesses.
10. They will be able to devise strategies to use financial analysis and improve a firm's performance.
11. They will learn the art or methods for analyzing projects, application techniques, and comprehensive decision power if there are conflicting recommendations.
12. The students will come to know about how accounting statements are prepared with the ability to interpret these and other financial and managerial accounting information in an organizational context.
13. The students will come to know about the sources, uses and management of finance within the organization and its relationship with external financial markets and the management of risk.
14. The students will develop analytical skills
15. The students will learn about the financial theories, analysis, reporting, and markets.

Course Code: ECN101	Course Name: Principles of Microeconomics	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

This course is an introductory course and deals with the principles of microeconomics. The course is intended to provide the student with the basic issues concerning microeconomics covering economic concepts, economic approach, demand, supply, and price, along with the analyses of consumer and producer behavior both in the short and long runs. It also covers market structure with explanation of characteristics of different market forms for goods and services as well as factors of production. Some highlights are reviewed about market failure, role of government, taxation and public expenditure, and environmental protection. The main learning outcome of the course will be as follows:

1. The students will learn about the macro- and micro-economic concepts and methods of economic analysis and they will also develop the ability to apply these to a range of business problems.
2. The students will learn about the increasing importance of sustainability.
3. The students will be able to understand domestic and global economic environments of organizations.

Course Code: ECN102	Course Name: Principles of Macroeconomics	
Credits: 3 (3+0+0)	Pre-requisite: ECN101	Language: English

This course is an introductory course and deals with the principles of macroeconomics. The course is intended to provide the student with the basic issues concerning macroeconomics covering economic concepts, economic approach, measurement of national income, models of macroeconomics, aggregate demand and aggregate supply in both short and long runs. The course also covers economic growth, money, and banking, economic fluctuations and international trade economics. The main learning outcome of the course will be as follows:

1. Understand basic concepts of macroeconomics such as variables, fluctuations, and trends.
2. Understand the macroeconomic models, in the short run and the long run.
3. To comprehend and apply the concepts of macroeconomic models to analyze economic problems and prescribe appropriate policies and correcting measures both in the short and long runs.
4. Analyze the concept of equilibrium national income, aggregate expenditures, factor incomes, value added, and determination of national income in the economy.
5. Examine the conditions for macroeconomic equilibrium and the impact of aggregate demand, aggregate supply and price level, both in the short and long runs.
6. Understanding different economic theories of growth as applied to various macroeconomic models and applications.
7. Understanding money and banking economics and monetary policies with respect to transmission mechanism, growth, and macroeconomic equilibrium.
8. Understanding the macroeconomics of international trade and finance as applied to trade and finance policies and international economics.
9. Acquiring the skills and abilities to explain various macroeconomic problems, analyze the main causes, major consequences and outcomes, and suggest the appropriate macroeconomic policies.
10. Ability to build and design macroeconomic models that help to understand the structure and functioning of any economy of interest.

Course Code: MKT101	Course Name: Principles of Marketing	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

The objective of this course is to develop an understanding of the basic elements in marketing strategy such as product planning, market selection, distribution and pricing. In addition it also focuses on the process of integrating all these elements in a coherent marketing mix. The course starts with definitions and discussions on basic concepts of Marketing, the evolution of Marketing and its role in business and economy. This is followed by an analysis of the environments in which Marketing operates, Market Types and analysis (of Consumer markets and Industrial markets), Measuring and Forecasting Market Demand, Marketing Information System, Segmentation, Targeting and Positioning. The course then ends by discussing the Marketing mix elements by emphasizing on the important decisions related to product, price, promotion, distribution and logistics and processes. Other special topics include International marketing, service marketing, and social marketing with some aspects of roles of IT in marketing.

Accordingly, the main learning outcomes will be as follows:

1. To be acquainted with the basic concepts of marketing and how it has evolved.
2. To understand the basic elements of the marketing mix, and their relationship with the surrounding environments.
3. An understanding of the consumer buying decision process and to identify the various factors which influence consumer behavior.
4. To demonstrate how marketers can benefit from studying and analyzing consumer behavior when designing the marketing mix.
5. To be aware of the concept of market segmentation and its importance to marketers. Moreover, to understand how consumer market and organizational/ industrial market can be segmented.
6. To learn the definitions of product and related definitions. Also, to become familiar with various classifications of products (product types) and the impact on marketing.
7. To be familiar with the concept, considerations, and strategies of pricing.
8. To understand the role played by promotion in the marketing mix of an organization.
9. To be familiar with the concept, importance of distribution and types of channels of distribution.
10. To understand the distribution channel management process. Also to be aware of the different types of distribution outlets, whether wholesaling or retailing outlets.
11. They students will understand the creation of value through the integrated production and distribution of goods, services and information.
12. They will understand the customer expectations and the importance of a customer orientation and customer service to all organizations.
13. They will learn the fundamentals of marketing and consumer behavior, and the processes by which marketing plans and strategies are constructed.

Course Code: MIS101	Course Name: Principles of MIS	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

This course aims to introduce students with the survey of MIS concepts, Information systems for operational, tactical and strategic management in the various functions of an organization. It will also include an overview of end-user computing. The main learning outcomes of the course are as follows:

1. The students will be able to understand the management and exploitation of information systems and the use of broader information and communication technologies.
2. The student will learn about the Information technologies as they influence the structure and processes of organizations and economies, and as they influence the roles and techniques of management.

Course Code: ACC101	Course Name: Principles of Accounting-I	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

This course aims to impart knowledge of accounting as an important information system in economic entities, with special emphasis on accounting cycle in both service and merchandising companies, recording entries, posting, preparing, and preparing trial balance, income statement, change in equity statement, and balance sheet. It also covers merchandising operations under both periodic and perpetual inventory systems. The main learning outcomes of the course will be as follows:

1. The students will learn about how accounting statements are prepared with the ability to interpret these and other financial and managerial accounting information in an organizational context.
2. The students will develop analytical skills.
3. The students will learn about the financial theories, analysis, reporting, and markets.

Course Code: ACC102	Course Name: Principles of Accounting-II	
Credits: 3 (3+0+0)	Pre-requisite: ACC101	Language: English

Accounting principles and techniques underlying the financial statements of partnerships corporations, accounting for stocks and dividends, accounting for bond issues, statement of cash flows, general price level adjusted financial statements, analysis of financial statements, cost accounting systems for manufacturing concerns, cost-volume-profit analysis, responsibility accounting, and budgeting, cost-revenue analysis for decision making, and utilization of basic accounting software packages. The main learning outcome of the course will be as follows:

1. The students will learn about how accounting statements are prepared with the ability to interpret these and other financial and managerial accounting information in an organizational context.
2. The students will develop analytical skills.
3. The students will learn about the financial theories, analysis, reporting, and markets.

Course Code: STA101	Course Name: Statistics Methods for Mgmt. I	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

This course is intended to provide the students with an introduction to statistics methods for management covering basic functions of arranging data to convey meaning, frequency, distribution tables, measures of central tendency and dispersion in frequency distribution, probability and probability distribution. The main learning outcome of the course will be as follows:

1. The students will learn the methods for the analysis and synthesis of data using a range of mathematical techniques, supported by appropriate software to inform business decisions.
2. The students will develop analytical skills.
3. The students learn statistical data analysis and management science as they support decision-making processes throughout an organization.

Course Code: BUS111	Course Name: International Business Law	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

Business Law provides students a comprehensive understanding of the legal issues of fundamental importance to the businesses. The students will learn about the nature and origin of business contracts; creating contracts viz., offers, and acceptance; consideration; capacity to contract; voluntary consent; Illegality; the form and meaning of contracts; third party contract rights, performance and remedies; formation and terms of sales contracts; warranties and product liability; performance of sales contracts, and remedies for breach of contracts. Besides, students will also learn about the agency relationship' creation, duties, and termination; liability of principals and agents to third parties; employment laws. The students will also understand the form of business organizations; partnerships firms; formation and termination of corporations; management of the corporate business. This course will also give an insight of negotiable instruments; Negotiation and Holder in due course liability of parties; checks and electronic fund transfer; and introduction to security in relation to cash credit to the students of College of Business Administration. The students will examine the relationship of law and ethics due process, contract law, court systems, and methods of dispute resolution. Business dispute cases and current issues in the business law will provide facts and analysis to illustrate law in action. The main learning outcomes of the course will be as follows:

1. The students will be able to understand the legal environment within which local, regional and international commerce is conducted.
2. The students will develop communication abilities.
3. The students will develop ethical understanding and reasoning abilities.
4. The students will develop ethical and legal responsibilities in organizations and society

Course Code: MATH131	Course Name: Finite Mathematics	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

Linear equations and inequalities, systems of linear equations, basic material on matrices, elementary introduction to linear programming. Counting techniques, permutations and combinations. Probability for finite sample space, basic concepts in statistics. Topics in the mathematics of finance. The main learning outcomes of the course will be the development of analytical skills.

Course Code: MATH132	Course Name: Applied Calculus	
Credits: 3 (3+0+0)	Pre-requisite: MATH131	Language: English

The derivative, rules for differentiation, derivative of logarithmic, exponential, and trigonometric functions, differentials, growth and decay models. Definite and indefinite integrals, techniques of integration, integrals involving logarithmic, exponential and trigonometric functions, integration by tables, area under a curve and between curves. Functions of several variables, partial derivatives and their applications to optimization. The main learning outcomes of the course will be the development of analytical skills.

Course Code: MGT223	Course Name: Business Communication	
Credits: 3 (3+0+0)	Pre-requisite: ENGL 214	Language: English

The course focuses on the knowledge and skills associated with clearly receiving, transmitting and communicating information within the business environment. Using communication theory and practical application, students will develop effective writing, speaking, and presentation skills required conveying a business' communication strategy. Besides, covering the broad scope of topics in all forms of business communication, this course introduces a student-friendly writing style and strong design elements to hold students' attention. Real-world examples and real business applications underscore the relevance and importance of the material to the business communication students' academic and career work. Independent and group work activities will be incorporated to the learning environment in order to apply the students' communication skills and knowledge to topics of teamwork, customer relations and leadership. The main learning outcome of the course will be as follows:

1. The students will be able to understand the essentials of efficient and effective business communication, thereby transforming them into leaders for a networked world.
2. The students will be able to understand the management and exploitation of information systems and the use of broader information and communication technologies.
3. The students will develop communication abilities.
4. The students will develop reflective thinking skills.

Course Code: MGT312	Course Name: Organizational Behavior	
Credits: 3 (3+0+0)	Pre-requisite: MGT 101	Language: English

This course is based on a proposition that managing people, structure, and processes in organizations is a challenging, compelling, and crucial set of tasks. This course will provide an opportunity to students to look inside organizations and to develop their own perspective and skills for managing organizational behavior. It will introduce students to theories, research results, and applications that focus on managing organizational behavior in small, large, and multinational organizations. Since effective management of organizational behavior requires an understanding of theory, research and practice, through this course students will comprehend the three generic characteristics of organizations namely behavior, structure, and processes that are affected by actions of managers. The main learning outcome of the course will be as follows:

1. The students will understand theories which explain individual and group behaviors and their relationship with the internal functioning of the organization.
2. The students will understand effective strategies for the management and development of people within the organization.
3. The students will understand group and individual dynamics in organizations.

Course Code: MGT402	Course Name: Strategic Management	
Credits: 3 (3+0+0)	Pre-requisite: FIN101 & MGT223	Language: English

This course focuses on teaching the basics and general principles of strategic management. It also aims to provide understanding of the processes of planning and strategic analysis of the firm, applying strategic decisions, and control, through the use of the techniques of case studies analysis to the students. This course also explains strategies formulation and their implementation by the business firms at all the level of functioning viz., Corporate, Business, and Functional. In this course the focus will be given to case studies based learning, presentations of industry specific organizations strategies, group discussions on the practical application of theories of strategic management, playing management games, and short term projects assignments etc. The main learning outcome of the course will be as follows:

1. The students will understand the creation of value through the integrated production and distribution of goods, services and information.
2. The students will understand the customer expectations and the importance of a customer orientation and customer service to all organizations.
3. The students will understand the fundamentals of marketing and consumer behavior, and the processes by which marketing plans and strategies are constructed.
4. The students will understand the effective strategies for the management and development of people within the organization.
5. The students will understand business policy and strategy; how appropriate policies and strategies are developed to meet the challenges of a changing environment and to achieve organizational goals.

Course Code: MIS212	Course Name: System Analysis & Design-I	
Credits: 3 (2+1+3)	Pre-requisite: MIS101	Language: English

This course is intended to provide the students an introduction to system analysis, methods, covering the basic functions of system analyst. It describes the work of system analysts and the tasks of, investigating system requirements, modeling system requirements, traditional & object-oriented approach to user requirement, evaluating alternatives for requirements, analyst tasks in the design phase, and the traditional approach to design.

After completing the course, students will be able to understand the following:

1. To learn fundamental knowledge and skills in various system development methodologies, techniques and tools.
2. To learn the necessary conceptual foundation to apply both traditional and object oriented approaches in system development environments.
3. To learn the commonly used analysis and design tools in traditional system development approach like data flow diagram, data dictionary, entity relationship diagram, structure chart and process specifications.
4. To learn and apply development methodologies, tools and techniques discussed in classroom in a real life group project.
5. To possess fundamental knowledge and skills in various system development methodologies, techniques and tools.

Course Code: MIS201	Course Name: Integrated Systems & Managing ERP Functions	
Credits: 4 (2+1+3)	Pre-requisite: MIS101 & ACC101	Language: English
The primary purpose of this course is to lay out the scope of ERP systems implementation, explain the competitive advantages of using ERP systems and support general concepts with short case studies. The course covers the fundamental issues important in ERP implementation and management, starting from an information system, information technology project management perspective. The course includes a review of real cases of ERP implementations related to that particular chapter content. The course is meant to be software product independent in order to prepare the student for any ERP systems software tools used in most midsize to large (major) corporations. The main learning outcome of the course will be as follows: • Enterprise Resource Planning Systems • ERP System Options and Selection Methods • Business Process Reengineering and Best Practices • ERP Project Management • Business Intelligence Systems and ERP • ERP and Supply Chains • Advanced Technology and ERP Security 6. Trends in ERP		

Course Code: MIS224	Course Name: Fundamental of Computer Networks	
Credits: 3 (3+0+3)	Pre-requisite: MIS212	Language: English
Computer networking is a rapidly advancing field. The Internet is already an integral part of society. This course will emphasize on the architecture, algorithms and protocols of the Internet. The topics that are included in the course are: local area networking, routing, congestion control, network security and applications such as peer-to-peer and content distribution networks. This course will be project-centric and students will work in groups with hands-on projects on how to build Internet applications as well as network protocols.		

Course Code: MIS200	Course Name: Fundamentals of Electronic Commerce	
Credits: 3 (3+0+3)	Pre-requisite: MIS101	Language: English
The course is approached from a managerial perspective on applications and implementations of electronic commerce. After the introduction to electronic commerce the course develops the student's knowledge of e-commerce utilization in retailing, supply chains, e-learning to support services and its development. The technical aspects of security and system development are briefly discussed. After completing this course, students are expected to possess the following knowledge and skills: • Apply the fundamentals of student business courses to electronic transactions. • Define and comprehend the terminology of electronic transactions. • Define and comprehend various business entities and arrangements to conduct business online. • Comprehension of consumer behavior with online transactions and modifying behavior through business techniques applicable to online transactions.		

- Become familiar with the working of EC business arrangements ranging from supply chain management to internal operations to customer service and payment systems.
- Knowledge of economic and financial issues facing EC transactions and why they are important to business success.

Course Code: MIS313	Course Name: System Analysis & Design-II	
Credits: 3 (3+0+3)	Pre-requisite: MIS212	Language: English
This course familiarizes students with the steps involved in developing computerized business information systems using CASE tools, 4GL and IT Project Management. Students will learn advanced concepts in systems analysis and design through deep involvement in analyzing real business information systems. After completing the course, students will be able to understand the following: 7. System development methodologies, the traditional system life cycle, prototyping, rapid application development (RAD), phased development methodology. 8. System development phases, focusing on the preliminary construction phase, final construction phase and system test and installation. 9. Project management planning tools- the project management mechanism, Gantt charts, network diagrams, CPM (Critical Path Method)/PERT (Program Evaluation Review Technique), project cost management. 10. Computer – Aided Software Engineering (CASE) - CASE tool categories, CASE as a project management tool, CASE impact on the SDLC. 11. Development of computerized business systems using CASE tools, DBMS.		

Course Code: MIS324	Course Name: Business Data Management	
Credits: 4 (2+1+3)	Pre-requisite: MIS212	Language: English
This course provides a managerial understanding and approach to the technical subject of database management. The course will illustrate the important role that database systems play in an organization and provide you with a background to understand the subject, and a foundation upon which to build your management decisions. This course is designed to investigate how database management system techniques are used to design, develop, implement and maintain modern database applications in organizations. The course would deliver the following: • Understand and evaluate the role of database management systems in information technology applications within organizations; • Recognize and use contemporary logical design methods and tools for databases; • Derive a physical design for a database from its logical design; • Implement a database solution to an information technology problem; • Understand the SQL data definition and SQL query languages; • Have been introduced to the alternative design techniques utilized for Management Reporting applications. • Develop sophisticated queries to extract information from large datasets.		

Course Code: MIS329	Course Name: Technology of E-Business	
Credits: 3 (3+0+3)	Pre-requisite: MIS212, MIS200	Language: English
The course is approached from a managerial perspective on applications and implementations of electronic commerce. The course continues the student's education on business principles applied electronically and develops their knowledge of electronic applications utilized. Applicable applications range from webpage design and development, website integration & determining compatible software systems, website security & privacy programs, electronic payment systems, order fulfillment systems & their relation to its corresponding supply chain, electronic commerce strategies amidst global competition & their financial justification and launching a successful EC project. Legal, social and technical influences upon electronic application development and its future are discussed as well. Upon completion of the course the student will be familiar with: • Related support services of security, payment, order fulfillment and so forth to e-commerce implementation. • Understand e-commerce strategy and describe its process and steps including justification, planning, implementation and assessment. • Describe the options of acquiring or building EC systems. • Understand the legal, social, ethical and business environments within which e-commerce operates. • Understand aspects in launching a successful EC project or business.		

Course Code: MIS303	Course Name: Social & Ethical Issues of Internet	
Credits: 3 (3+0+3)	Pre-requisite: MIS329, BUS111	Language: English
The course covers larger ethical and social issues of computing, including the role of a digital society in the modern world. The material includes information privacy & security, ethical & legal theories, value systems and their application to the networked digitized world. The course also provides a better understanding of how ethical and social issues of privacy, civil liberties, anonymity and workplace issues of harassment and discrimination are affecting the new computerized environment. Moreover, it will help the students to understand the basic cultural, social, legal and ethical issues inherent in the discipline of computing.		

Course Code: MIS325	Course Name: Fundamentals of Web Design	
Credits: 3 (2+1+3)	Pre-requisite: MIS324	Language: English
Fundamentals of Web Design is designed to introduce students the foundations of Web design including planning, creating and publishing a Web site. In addition, providing a brief history of the Internet and introducing basic vocabulary, the course also teaches students how to hand-code Web pages, create basic cascading style sheets to control the presentation of a Web page or site & identify the accessibility and usability issues that influence Web site design.		

Course Code: MIS338	Course Name: IT Service Management	
Credits: 3 (3+0+3)	Pre-requisite: MIS313	Language: English
This course is designed to gain the knowledge of the Information Technology Infrastructure Library (ITIL) terminology, structure & basic concepts and the core principles of ITIL practices for service management. After completion of this course the students will be able to: • Service management as a practice. • The ITIL service lifecycle. • Generic concepts and definitions. • Key principles and models. • Selected processes. • Selected functions. • Selected roles. • Technology and architecture. • Preparation for the exam (ITIL foundation).		

Course Code: MIS450	Course Name: MIS Coop Education	
Credits: 6 (0+0+6)	Pre-requisite: ENGL110, MIS338 and MIS324 and completion of 85 credit hours	Language: English
In order to fulfill the experiential learning objectives of our Internship Program, each student is required to work full-time at an approved private/public company or establishment (i.e. no less than 30 hours and no more than 40 hours per week) for one semester. During this period, the intern should assume a wide range of responsibilities.		

Course Code: MIS451	Course Name: Projects in MIS	
Credits: 3 (2+1+3)	Pre-requisite: ENGL110, MIS338 and MIS324 and completion of 85 credit hours	Language: English
This course provides comprehensive knowledge of both qualitative and quantitative research methods to student with special emphasis on student research projects. This course will introduce essentials of		

research, research methods, research instruments and statistical analysis of data to undergraduate students. The main learning outcome of this course will be as follows:

1. The students will learn methods of research, sampling techniques, research instruments and statistical analysis of data.
2. The students will learn the methods for the analysis and synthesis of data using a range of mathematical techniques, supported by appropriate software to inform business decisions.
3. The students will develop analytical skills.
4. The students will learn about ethics in business research related to information systems, data preparation and description; exploring, displaying and examining data; hypothesis testing measures of association and multivariate analysis.

Course Code: MIS461	Course Name: Selected Topics in MIS	
Credits: 3 (3+0+3)	Pre-requisite: ENGL110, MIS338 and MIS324 and completion of 85 credit hours	Language: English

Special Topics in Management Information System (MIS) present current MIS issues in a debate-style format designed to stimulate student interest and develop critical thinking skills. Each issue is thoughtfully framed with an issue summary, an issue introduction and a postscript or challenge questions. The main learning outcome of the course will be as follows:

1. The students will understand the best industry practices for system implementation.
2. The students will understand the impact of system planning, design and testing.
3. The students will understand the impact of information security at different managerial levels.
4. The students will understand key issues related database design and backup and recovery procedures.

Course Code: MIS425	Course Name: Information Security	
Credits: 3 (3+0+3)	Pre-requisite: MIS303, MIS224	Language: English

This course introduces the concepts & issues related to securing information systems and the development of policy to implement information security control. The topics that are included in the course are: the historical view of networking and security, security issues, trends, security resources & the role of policy, people, and processes in information security. After completion of this course the students will be able to identify information security risks, create an information security policy & identify processes to implement and enforce policy.

Course Code: MIS409	Course Name: Decision Support Systems	
Credits: 3 (2+1+3)	Pre-requisite: MIS201, MIS324	Language: English
This course is designed to introduce the student to the fundamentals of the Management Support System (MSS) technologies: Decision Support Systems (DSS), Group Decision Support Systems (GDSS), Enterprise Support Systems (ESS), Expert Systems (ES) and Artificial Neural Network Systems (ANNS). The focus of these systems will revolve around the Intelligence Systems. Case studies will be discussed to enhance the understanding of the impact of these systems on today's managerial decision making. By the end of the course, the student should be able to understand the synergetic effect that may result from the integration of these independent systems in supporting managerial decision making. After completing this course, students are expected to possess the following knowledge and skills: • Be able to design and use decision support systems and Expert systems • Develop the skill how to solve a business problem using Management Support Systems • Utilize Management Support Systems over the internet • Be aware of the utilization of AI applications in business • Apply management support systems techniques and technologies in enhancing the managerial decision making in organizations.		

Course Code: MIS431	Course Name: Project Management System Applications	
Credits: 3 (2+1+3)	Pre-requisite: MGT346	Language: English
Information is traveling faster and being shared by more individuals than ever before. Although project management has been an established field for many years, managing information technology requires ideas and information that go beyond standard project management. By weaving together theory and practice, this course presents an understandable, integrated view of the many concepts skills, tools and techniques involved in project management. Because the project management field and the technology industry change rapidly, one cannot assume that what worked even five years ago is still the best approach today. This course provides up-to-date information on how good project management and effective use of software can help you manage projects, especially information technology projects. Topics covered include: Introduction to Project Management The Project Management and Information Technology Context The Project Management Process Groups: A Case Study Project Integration Management Project Scope Management Project Time Management Project Cost Management Project Quality Management Project Human Resource Management Project Communications Management Project Risk Management Project Procurement Management		

Project Stakeholder Management

Course Code: MIS 102	Course Name: Introduction to Technology	
Credits: 3 (3+0+3)	Pre-requisite:	Language: English
This course aims to introduce students to MIS concepts as well as information systems for operational, tactical and strategic management in various functions of an organization. It will also include an overview of end-user computing. The main learning outcomes of the course are as follows: - The students will be able to understand the management and exploitation of information systems and the use of broader information and communication technologies. - The student will learn about the information technologies how they influence the structure & processes of organizations and economies as well as the roles and techniques of management.		

Course Code: MIS 326	Course Name: Data Structure	
Credits: 3 (3+0+3)	Pre-requisite:	Language: English
The purpose of this course is to provide the students with solid foundations in the basic concepts of programming, data structures and algorithms. The main objective of the course is to teach the students how to select & design data structures and algorithms that are appropriate for problems that they might encounter. This course is also about showing the correctness of algorithms and studying their computational complexities. This course offers the students a mixture of theoretical knowledge and practical experience. By the end of the course the students will be able to: - Understand the concepts of the Data Structures. - Define and use standard data structures classes. - Design program with different data structures: array, linked list, stacks, queues, trees and hash tables. - Describe common applications for each data structure in the topic list. - Compare alternative implementations of data structures with respect to the performance. - Compare and contrast the costs and benefits of dynamic and static data structure implementations. - Choose the appropriate data structures for modeling a given problem		

Course Code: MIS 327	Course Name: Operating Systems	
Credits: 3 (3+0+3)	Pre-requisite:	Language: English
This course is designed as an introduction to operating systems. It is intended for students with a basic background in computing systems. The first portion of the course presents the basic concepts of operating systems. The second portion of the course covers specific issues with operating systems in widespread use today. After completing this course, students are expected to obtain the following knowledge and skills: - To give computer users a solid background in the basics of operating systems, their functions and goals, and how they interact and interrelate. - To introduce students to fundamentals of memory and file management.		

- To introduce network organization concepts, topologies, types, packets and circuit switching.
- To introduce operating systems of Windows and MS-DOS.

This course presents fundamental concepts related to the design and implementation of operating systems. The first part of the course addresses the problem of memory management; it will cover topics such as linking, dynamic memory allocation, dynamic address translation, virtual memory, and demand paging. The second part of the course discusses concurrency: how to manage multiple tasks that execute at the same time and share resources. Topics in this section include processes and threads, context switching, synchronization, scheduling, and deadlock. The third major part of the course concerns file systems, including topics such as storage devices, disk management and scheduling, directories, protection, and crash recovery.

Course Code: MIS 403	Course Name: Information Resource Management	
Credits: 3 (3+0+3)	Pre-requisite:	Language: English
Information Resource Management encompasses planning, budgeting and supervising of facilities, systems and organizations. It covers both the information itself and related resources such as personnel, hardware, software, funds and technology. After successfully completing this course, students should have:		
•some understanding of the fields of Information Resource Management (IRM); •a reasonable understanding of the terminology involved; •a reasonable grasp of the range of technologies involved;		

Course Code: MIS 408	Course Name: Integrated Information Systems	
Credits: 3 (3+0+3)	Pre-requisite:	Language: English
The strategic importance of information technology is now widely accepted. It has also become increasingly clear that the identification of strategic applications alone does not result in success for an organization. A careful coordination of strategic applications, information technologies, and organizational structures must be made to attain success. This course addresses strategic, technological, and organizational connectivity issues to support effective and meaningful integration of information and systems. This course is especially relevant to those who wish to effectively exploit information technology and create new business processes and opportunities.		
This course covers role of information systems in the overall strategy and management of organizations; organization management; information resources: personnel, planning and control, technological trends, management implications, managing MIS department; outflow of information; documents generation and distribution; team management and emerging new issues in Integrated Information Systems.		

Course Code: MIS 414	Course Name: Simulation & Modeling Information Systems	
Credits: 3 (3+0+3)	Pre-requisite:	Language: English
The course provides an introduction to the modeling and simulation with special emphasis on decision-theoretic models and rational decision-making. The ability to make good decisions is key to individuals		

and organizations and studying, understanding and improving decisions is vital to success. Students are given a background into systematic decision-making processes and are then introduced to formal methods for decision modeling and analysis. Building on these foundational models, students learn how to perform process modeling and optimization. Finally, the course concludes with a look at psychological biases and traps that may affect decision-makers.

Course Code: MGT201	Course Name: Operations Management	
Credits: 3 (3+0+0)	Pre-requisite: MGT 101, STA 101	Language: English

The students are introduced to the frameworks, key concepts and tools needed to design, implement, control and improve the value chain of operating systems. The course covers management of production and service operations, including capacity planning, process and layout design, and TQM; applications of quantitative techniques like linear programming, forecasting, inventory models, waiting line models, CPM/PERT, simulations and decision theory are discussed within the operations environment. The main learning outcomes of the course will be as follows:

1. The students will understand the increasing importance of sustainability.
2. The students will understand creation of value through the integrated production and distribution of goods, services, and information.
3. The students will understand information technologies as they influence the structure and processes of organizations and economies, and as they influence the roles and techniques of management.

Course Code: MGT212	Course Name: Legal Environment	
Credits: 3 (3+0+0)	Pre-requisite:	Language: English

The course deals with the topics related to the nature and determinants of the legal environment of business with special focus on Kingdom of Saudi Arabia. It focuses on the legal aspects of individual and business transactions, the laws of employment, securities, real and individual property, intellectual property and cyber law, environmental law and regulation, rights of debtors and creditors, and legal rules relating to marketing, advertising, product liability, and company responsibility toward the consumer. The main learning outcomes of the course will be as follows:

1. The students will be able to understand the legal environment within which local, regional and international commerce is conducted.
2. The students will be able to understand the interrelatedness of all the different aspects of business, including their local, regional and international dimensions.
3. The students will be able to understand ethical and legal responsibilities in organizations and society.
4. The students will develop analytical skills.

Course Code: MGT245	Course Name: Business Analytics and Management Applications	
Credits:3 (2+2+3)	Pre-requisite:	Language: English

Manage, analyze, and distribute enterprise data with help from this expert resource. Delivering Business Intelligence with Microsoft SQL Server 2008 covers the entire BI lifecycle and explains how to build robust data integration, reporting, and analysis solutions for critical management decision making. Real-world examples illustrate all of the powerful BI capabilities of SQL Server 2008. This is your one-stop guide for transforming disparate data into actionable insight for managers. The course covers, but no limited to, the following areas of knowledge:

1. Effective decision-making
2. Business Intelligence (BI)
3. The Data Mart, (Snowflakes & Star Schemas), and Analysis Services
4. Online Analytical Processing (OLAP) and the Unified Dimensional Model (UDM)
5. The Business Intelligence Development Studio (BIDS) and SQL Server Management Studio
6. Designing a Data Mart and Integration Services
7. Building the Cube (Measures and Dimensions), and Advanced features of BI.

Course Code: MGT 302	Course Name: International Business	
Credits: 3 (3+0+0)	Pre-requisite: ECN102, MKT101, FIN101	Language: English

This course introduce students to many complex issues in international business, the pros and cons of economic theories, government policies, business strategies, organizational structures, etc. Through rigorous study students will understand the changing economic, political, legal and cultural, and environmental conditions and its impact on international business organizations. In this course students will study about the economic and trade globalization, nature of countries, global trade and investment environment, global monetary system, strategy and structure of international businesses, mode of international business operations etc.

The main learning outcome of the course will be as follows:

1. The students will understand the processes and practices for the effective management of organizations and decision-making within them.
2. The students will understand the sources, uses and management of finance within the organization and its relationship with external financial markets and the management of risk.
3. The students will understand the business policy and strategy; how appropriate policies and strategies are developed to meet the challenges of a changing environment and to achieve organizational goals.
4. The students will understand the dynamics of the global economy.
5. The students will understand domestic and global economic environments of organizations.

Course Code: MGT310	Course Name: Human Resource Management	
Credits: 3 (3+0+0)	Pre-requisite: MGT101	Language: English

The course provides an introduction to the field of human resource management. The objective is to increase the understanding of how human resource functions as a system contributes to achievement of organization's strategic objectives and how human resource management operates in a larger organizational, social, and legal context through the study of topics such as personnel administration like human resource planning, recruitment,

training and development, performance appraisal, legal issues, compensation, and labor relations. The main learning outcome of the course will be:

1. The students will develop knowledge and skills needed for careers in the large and growing human resources field.
2. The students will understand significance of Human Resources functions and be able to apply the knowledge to retain talent.
3. The students will acquire effective communication skills in a business environment.
4. The students will understand multicultural issues and diversity to function effectively in global and local business environments.
5. The students will understand group dynamics and interpersonal skills needed to be an effective leader and manager.
6. The students will understand customer expectations and the importance of a customer orientation and customer service to all organizations.
7. The students will understand effective strategies for the management and development of people within the organization.

Course Code: MGT346	Course Name: Project Management	
Credits: 3 (3+0+0)	Pre-requisite: MGT101	Language: English

The course provides the student with a core project management body of knowledge needed to manage various projects. The course covers the basic fundamentals of project management that are established by the Project Management Institute. This course fulfills one of the requisites needed for successfully completing the PMP certification examination. The following areas of knowledge are covered in the course:

1. Develop a mission statement, vision, goals, and objectives
2. Plan the project
3. Create the work breakdown structure
4. Produce a workable schedule
5. Understand earned value analysis
6. Manage a project team
7. Control and evaluate progress at every stage.

Fully updated based on the latest version of the Project Management Body of Knowledge (PMBOK®), the fourth edition contains new information and expanded coverage on the project risk plan; the change control process; the concept of the project manager as leader; and more. Students will be taught tips and techniques for planning and executing projects on time, on budget, and with maximum efficiency.

Program Key Performance Indicator (KPI's)
